Agentic Logistics Platform Build Guide

Visual screen templates functional requirements and development acceptance criteria

Version 1 26 October 2026 Kolkata 700031

Build the platform around the actual movement of parcels, seller stock and money. The launch system must record who owns each item, who has custody, what work is required, which courier or rider receives it, what was charged and what remains unsettled.

The operating context is one approximately 600 sq ft ground-floor hub in Selimpur, with about 11 ft frontage and a 15 ft approach road. Start with practical receiving, weighing, shelf locations, picking, packing and handover records. Keep branch identifiers in the data model so additional locations can be added later.

Three operating modes

Outbound courier booking: receive parcels from walk-in customers or customer collections, quote, book an authorised carrier, print the carrier label and record physical handover.

Courier-assigned delivery: accept an incoming carrier manifest, reconcile parcels and COD instructions, assign local deliveries and return delivery evidence and settlement records. Enable this mode only under the relevant carrier agreement.

Seller micro fulfilment: receive a seller's stock by SKU, store it by owner and location, reserve items for orders, pick, pack and dispatch. A sealed transit parcel is a different record from saleable stock.

Recommended navigation

Main menu	Working pages
Dashboard	Work queues, daily close, operational reports
Customers	Walk-in customers, sellers, contacts, agreements
Orders	Quotes, order entry, imports, fulfilment orders
Parcels	Receiving, bookings, labels, manifests, tracking, returns
Warehouse	Locations, receipts, stock, movements, pick and pack
Delivery	Customer pickups, assigned deliveries, rider runs, proof
Finance	Invoices, receipts, expenses, COD, settlements, disputes
Support	Cases, returns, delivery exceptions, claims
Settings	Staff, access, rates, taxes, integrations, audit

Launch principle: every service enabled for customers needs a complete operational and financial workflow. Self-service portals and advanced automation can follow the first reliable internal release.

Module catalogue and launch scope

Use the following 14 logical modules. Several share one navigation group; each needs its own permissions, records and completion tests.

ID	Module	Launch requirement
M01	Dashboard and reporting	Live work queues and daily close
M02	Customers and sellers	Required for every booking
M03	Orders and quotations	Manual order and quote entry first
M04	Parcels and receiving	Required before accepting parcels
M05	Courier booking and accounts	Verified manual workflow or approved connector
M06	Warehouse and inventory	Parcel locations first; SKU control before storing seller stock
M07	Fulfilment and dispatch	Handover control first; pick and pack before fulfilment
M08	Pickup and delivery	Required before operating your own riders
M09	Tracking and notifications	Traceable updates and exceptions
M10	Returns exceptions and claims	Required for the services launched
M11	Billing and payments	Required before accepting paid business
M12	COD and settlements	Required before enabling any COD
M13	Seller and customer portal	Self-service after the internal workflow is stable
M14	Administration access and integrations	Foundation for all modules

Changes to the four screenshot sections

Parcels: add customer booking, source and ownership, internal parcel identifiers, barcode receiving, measurement, courier booking, handover and exception queues. Replace weighbridge terminology with parcel-scale measurements.

Warehouse: add seller-owned stock, parcel shelving, bins, put-away, reservations, picking, packing and stock counts. Use logical receiving and dispatch zones suitable for the actual floor plan.

Delivery: cover customer collections, carrier handovers and own-rider delivery as separate task types. Carrier pickup does not mean delivery to the recipient.

Finance: separate service billing, courier costs, customer payments, COD custody, seller payables and bank matching. Replace a single fixed SAC label with configurable service tax mappings.

Shared additions: customers, orders, returns, integration monitoring, employee roles, seller access and audit history.

Interface system and shared screen rules

Use a consistent shipping dashboard pattern with a stable sidebar, global search, status tabs, practical filters, selectable records and an explicit primary action. Shiprocket's public product material is a workflow reference for order lists, courier selection, tracking and reconciliation. The following Agentic screens are original design templates using illustrative data. They are not live account views or quoted carrier rates. [4]

Element	Required treatment
Brand and actions	Brand accent #2596BE; darker primary action #146F8E; white action text
Canvas and text	Background #F5F7FB; panels white; text #182B43; secondary text #58677C
Status	Green for confirmed success; amber for action needed; red for blocked/error; include text labels
Desktop layout	Stable navigation; search and branch scope; page title; queue tabs; filters; table or task form
Mobile layout	Assigned task first; large scan and outcome controls; avoid wide tables; touch targets at least 44 px
Typography and density	Readable 16 to 18 px operational text; restrained headings; enough space for scanner and touch use

Forms: give every field a visible label, unit and requirement rule. Validate positive kg/cm, whole piece counts, Indian PIN format and serviceability. Distinguish quoted values from measured values, service payments from goods COD, and draft instructions from confirmed events.

Tables: support search, sorting, role-scoped exports and saved filters. Bulk operations show selected count, applicable grouping and per-record success/failure. Never hide a partial failure behind a success message.

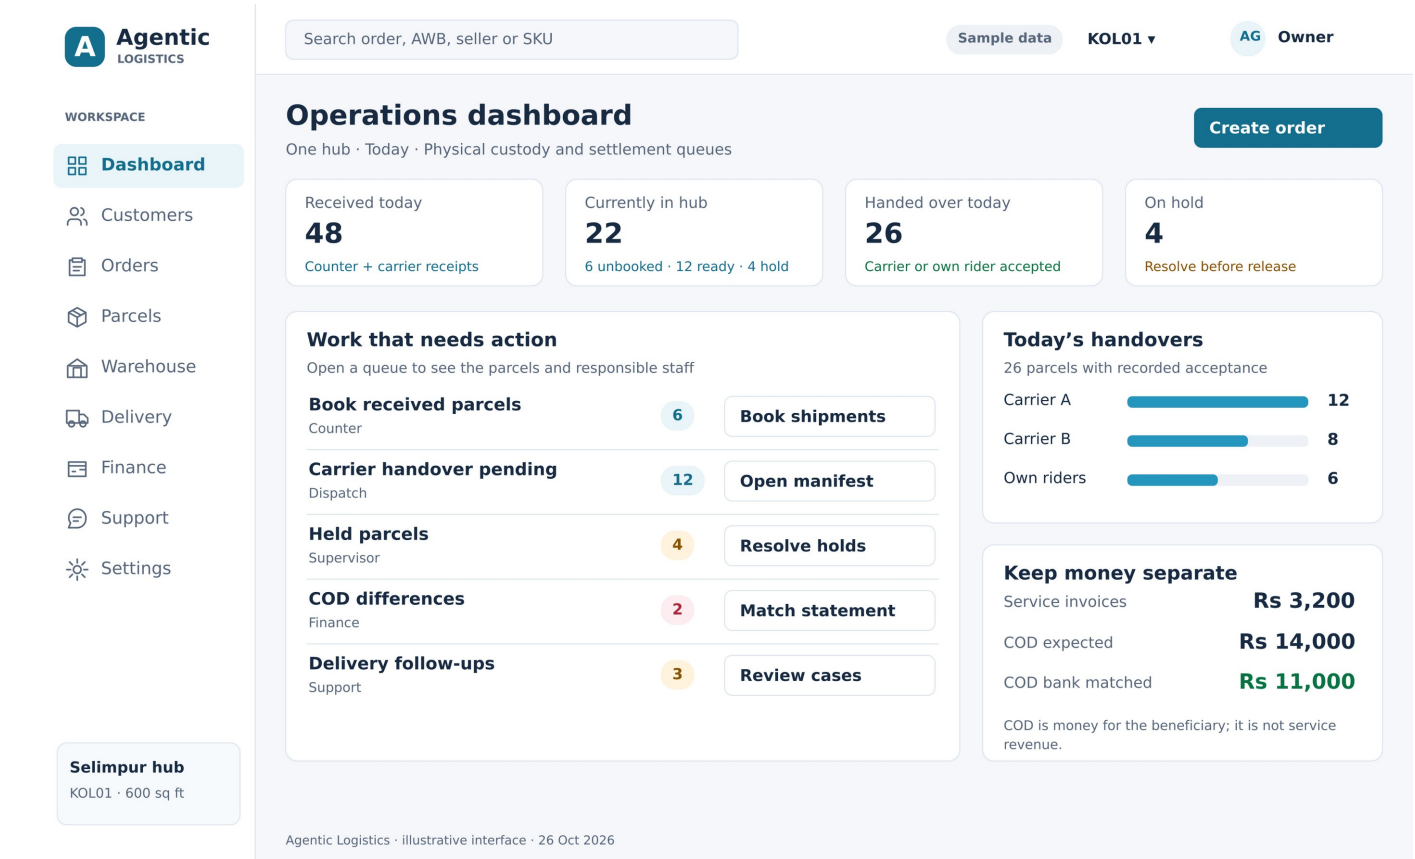

Screen states: loading shows progress rather than false zero totals; empty states explain the next task; errors preserve entered data; holds display a reason and owner. Stale integration data shows a last-update time. Destructive or financial changes require a clear review step.

Printing: preview the selected carrier label, preserve its required layout and test an actual 4 by 6 inch print with the scanner. An internal QR supplements the approved label and cannot replace the carrier barcode.

Visual figures: the nine templates on the following pages demonstrate the principal staff, seller and rider views. Detailed fields, permissions, integrations and acceptance criteria follow them. Secondary forms use the same screen rules.

Visual template 01 Operations dashboard

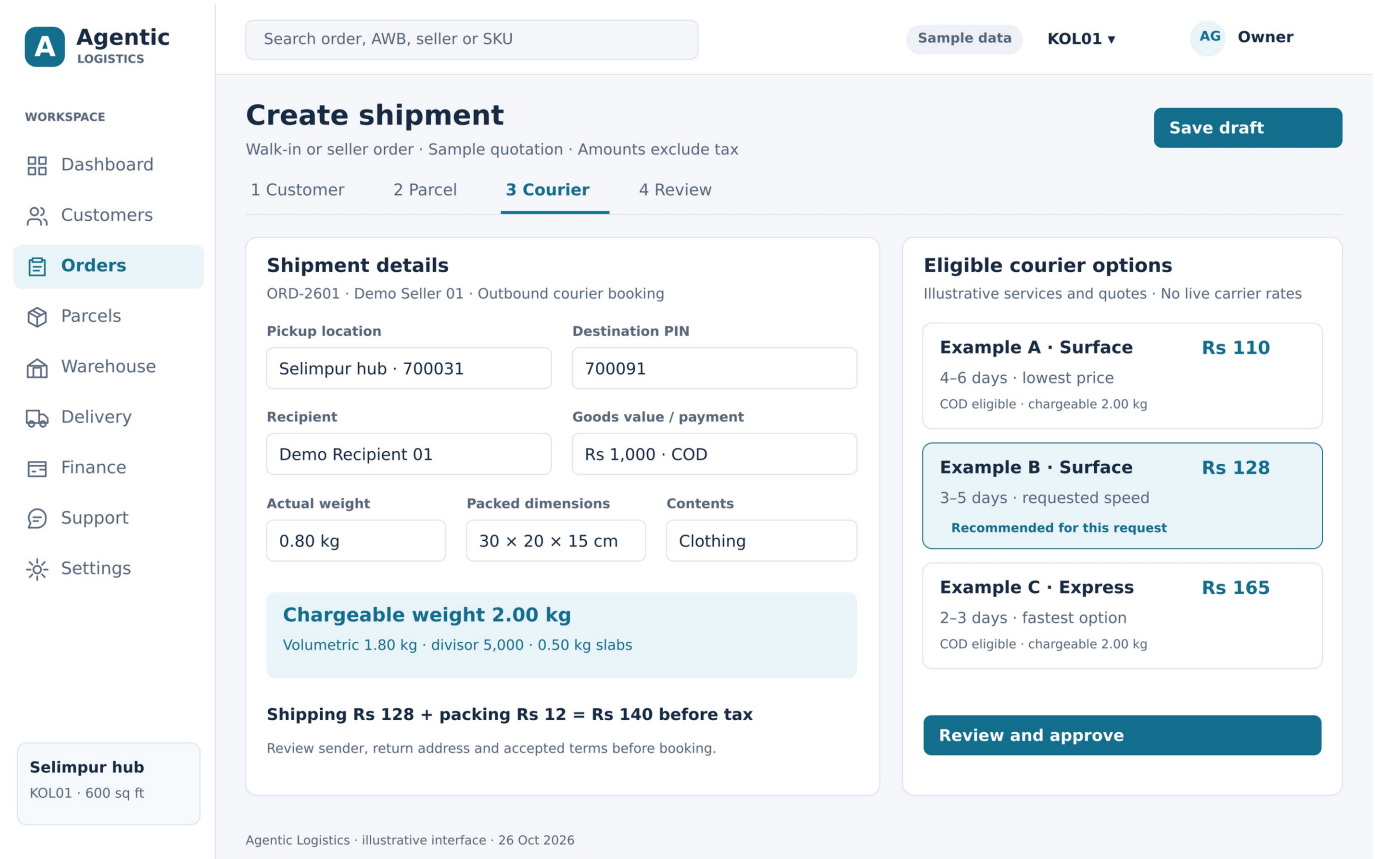

M01 and M14 Owner and supervisor Actionable queues before decorative analytics

Build behaviour: each metric opens its records. This example starts with no opening parcels: 48 received, 22 still in hub and 26 handed over. In production, current custody also includes overnight parcels and returns. Keep service invoices and COD money separate.

Visual template 02 Shipment booking

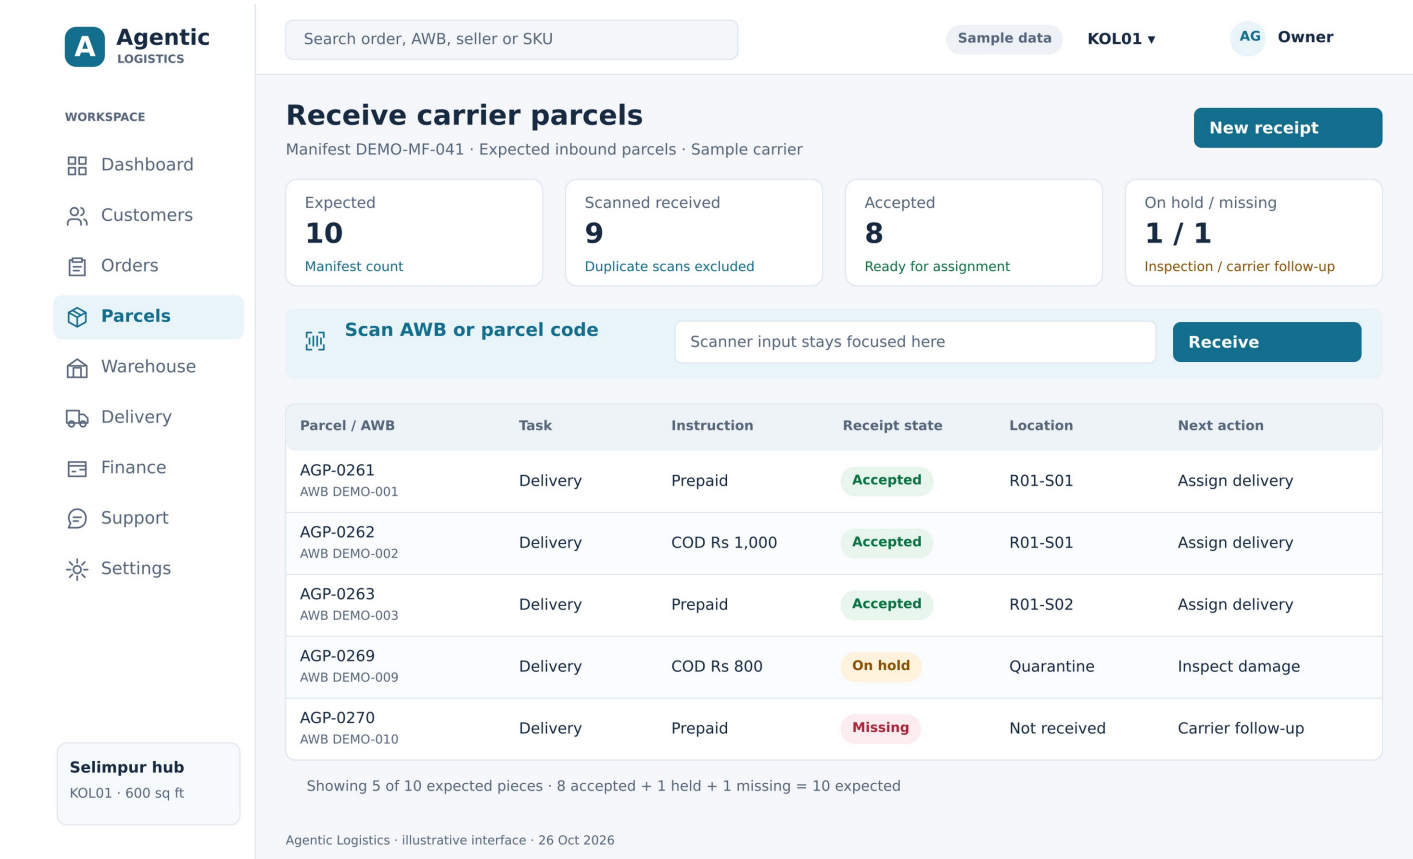

M02 M03 and M05 Counter and operations Validate the shipment before selecting a service

Build behaviour: compare eligible services on the same basis and explain the recommendation. Here 30 by 20 by 15 cm divided by 5000 gives 1.80 kg, rounded to 2.00 kg using the example slab. All provider names, prices and transit estimates are illustrative.

Visual template 03 Parcel receiving

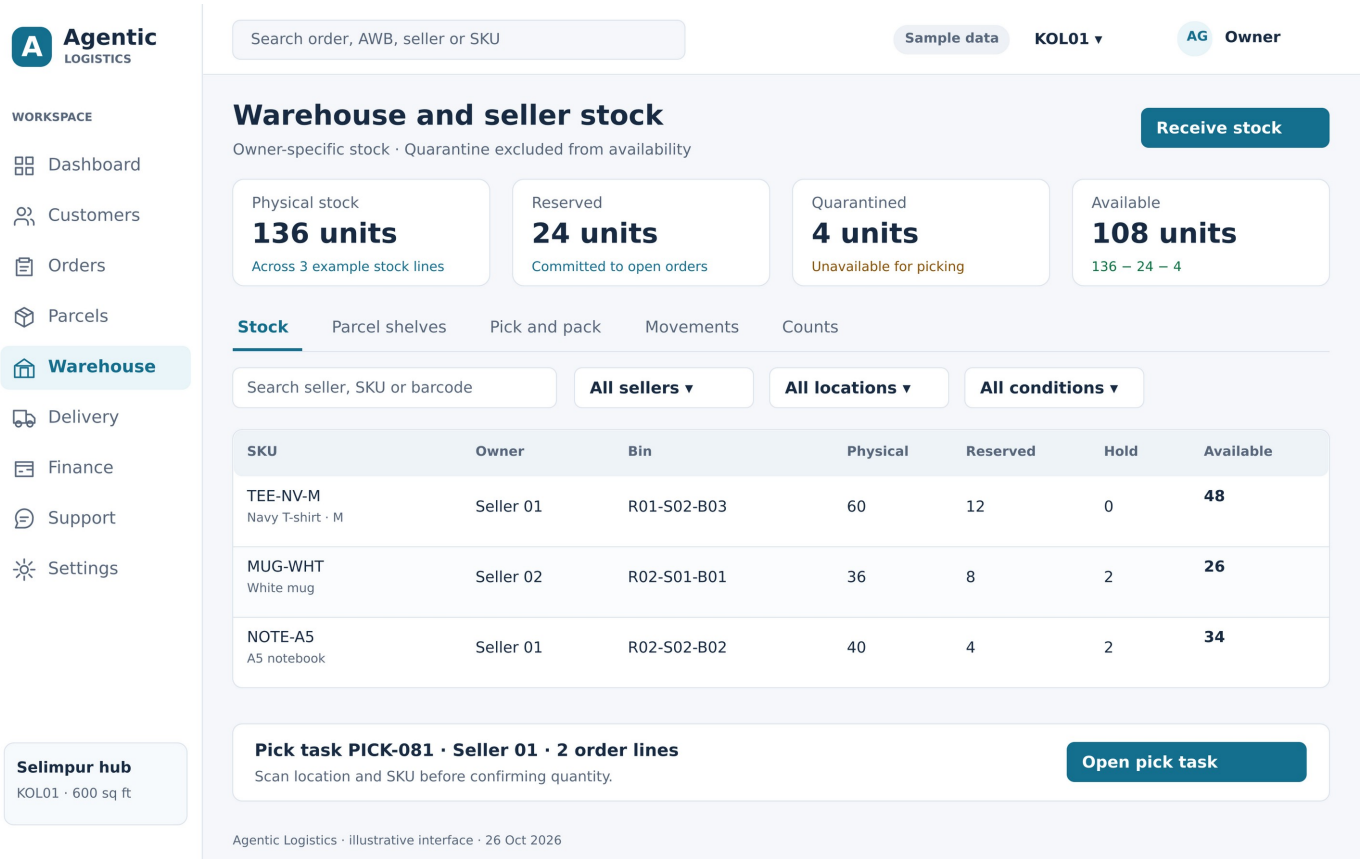

M04 and M08 Counter and receiving staff Scanner focus and discrepancy control

Build behaviour: match the expected manifest against actual pieces. The example has 10 expected, 9 scanned, 8 accepted, 1 held and 1 missing. A repeated scan cannot increase the count. Held pieces require resolution before allocation.

Visual template 04 Warehouse inventory

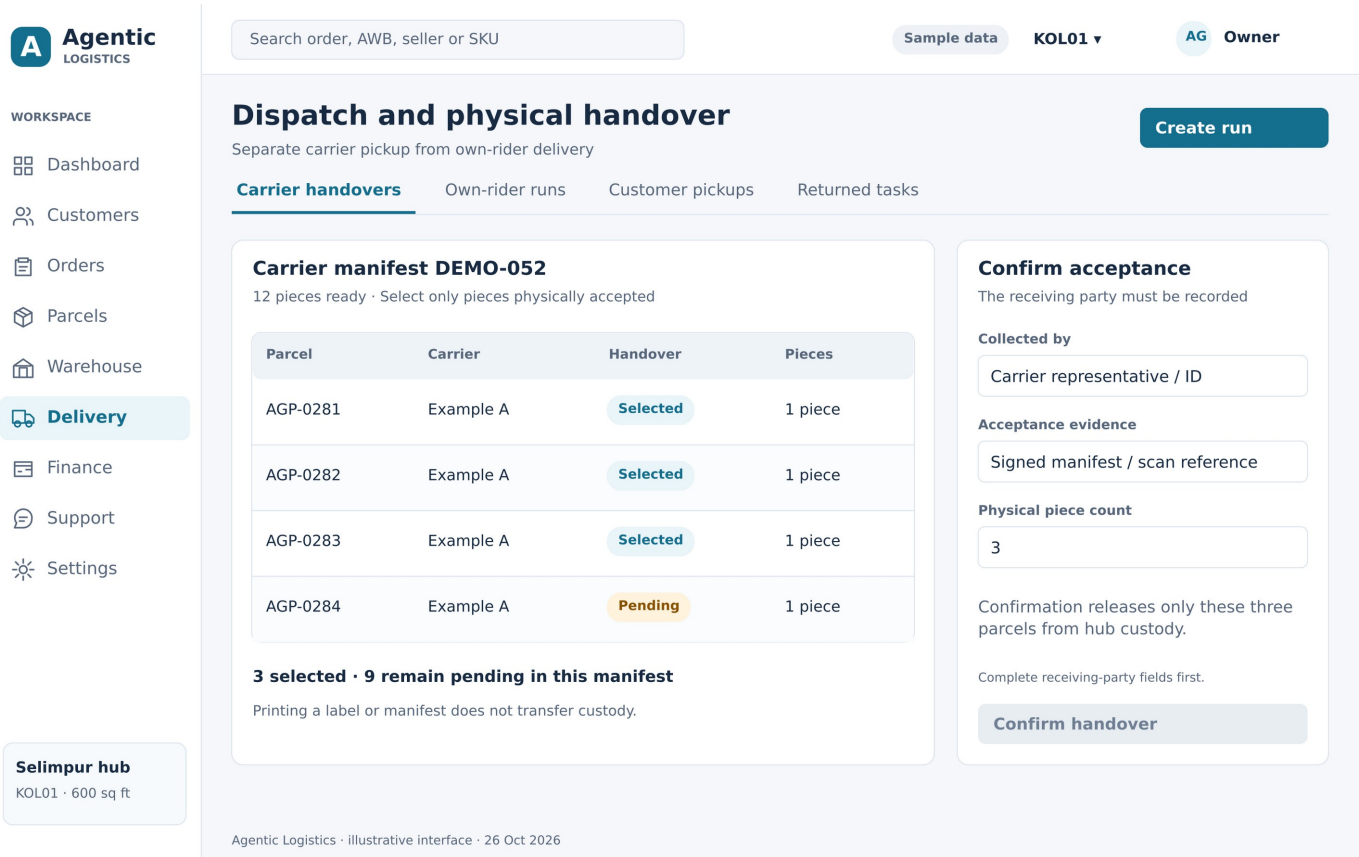

M06 and M07 Warehouse and supervisor Stock belongs to a seller and a physical location

Build behaviour: the example physical total of 136 less 24 reserved and 4 held leaves 108 available. The two seller owners remain separate. Shelf codes refer to configured locations; picking verifies the owner, SKU, location and quantity.

Visual template 05 Dispatch handover

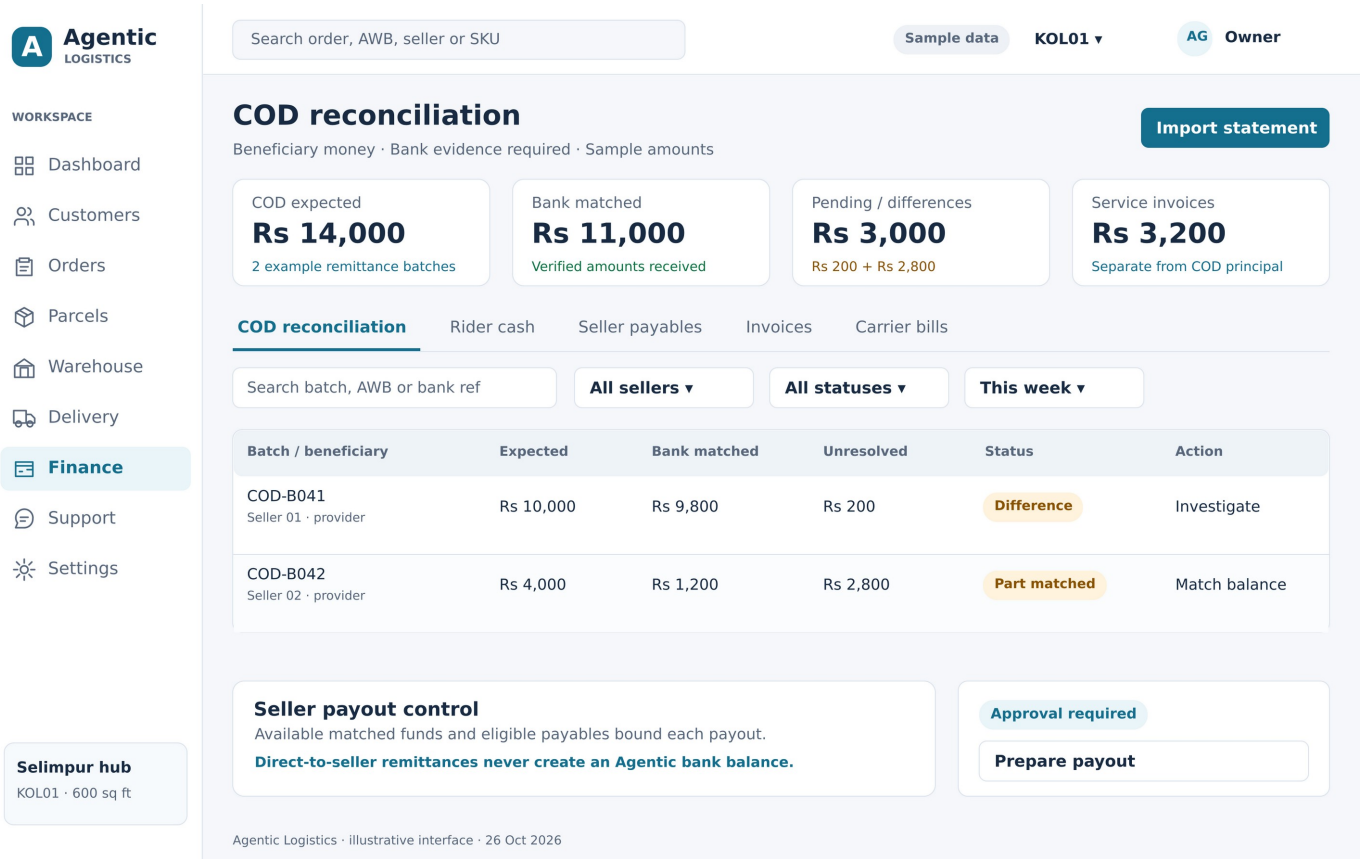

M05 M07 and M08 Dispatcher Confirm the actual pieces accepted by the receiving party

Build behaviour: handover is disabled until required receiving-party and acceptance details are supplied. A partial handover releases only accepted pieces and leaves the remainder pending. Carrier pickups and own-rider runs have separate tabs and task rules.

Visual template 06 COD reconciliation

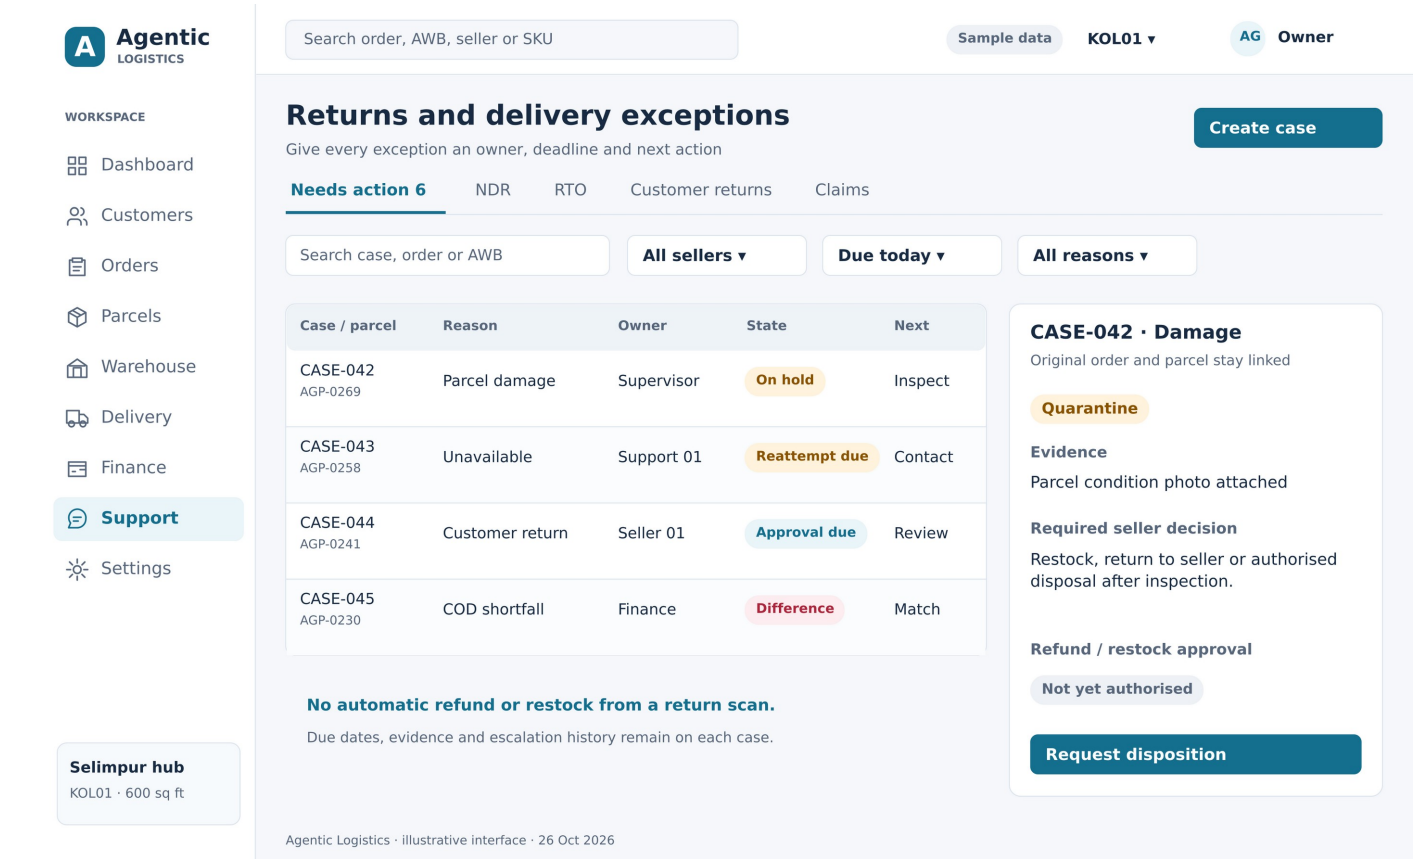

M11 and M12 Finance and owner Match beneficiary money to verified bank movements

Build behaviour: expected Rs 14000 equals Rs 11000 bank matched plus Rs 3000 unresolved in these two batches. Resolve differences before eligible payout. Service invoices are a separate measure. Provider remittances made directly to sellers follow a separate visibility route.

Visual template 07 Returns and exceptions

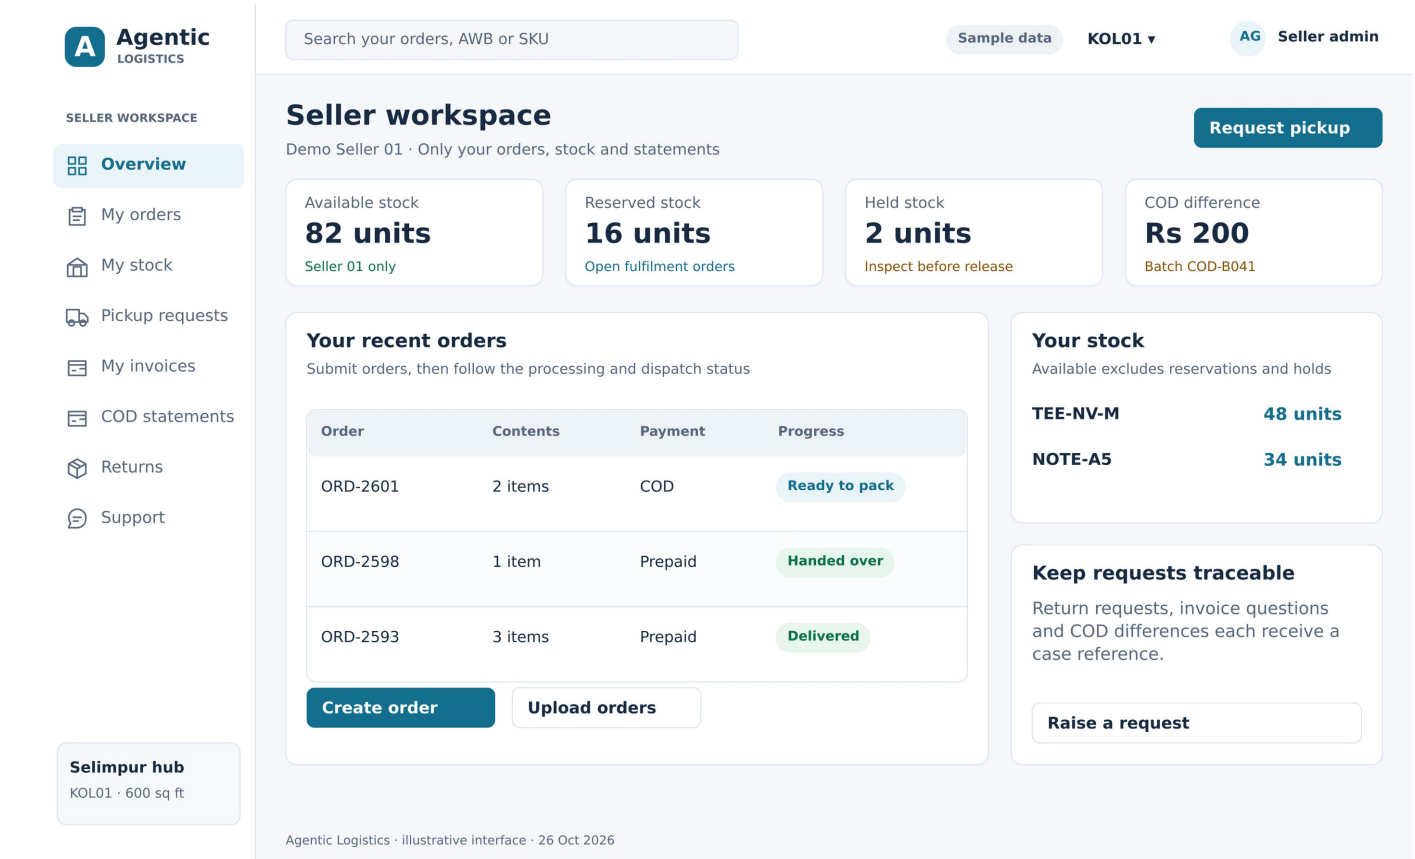

M09 and M10 Support and supervisor Every case has an owner and a next action

Build behaviour: retain the original order, parcel, evidence and due date on the case. Receiving a damaged return does not approve a goods refund or restock. Send the inspection result for the authorised seller or supervisor decision.

Visual template 08 Seller workspace

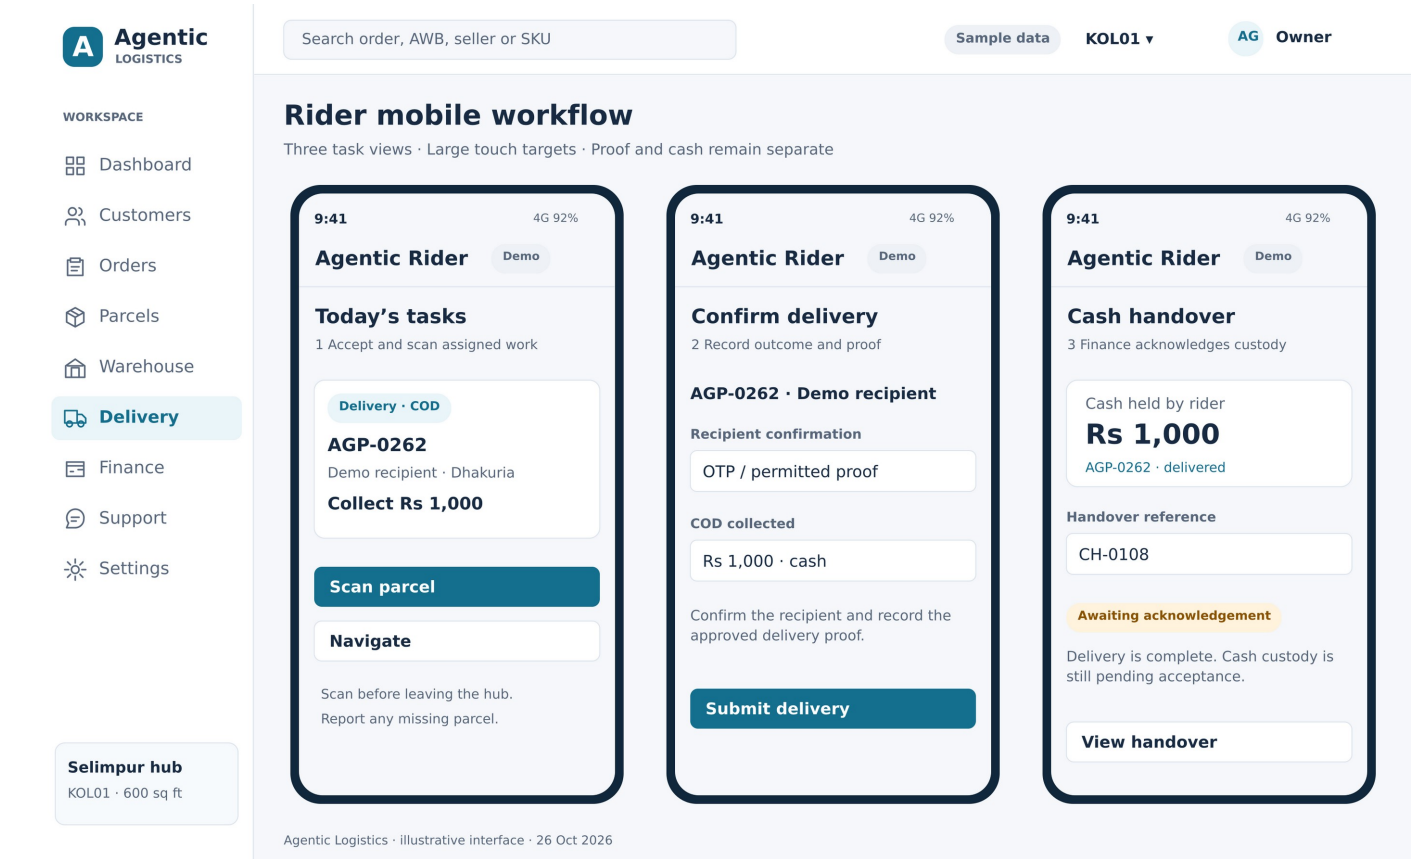

M02 and M13 Authenticated seller Show only the seller authorised by the session

Build behaviour: Seller 01 sees 82 available units, 16 reserved and 2 held across its own stock in the warehouse example. Separate its orders, invoices, COD statements and requests. Enforce this scope in the backend, including exports and document links.

Visual template 09 Rider mobile workflow

M08 and M12 Assigned rider and receiving finance staff Task evidence and cash custody are separate

Build behaviour: accept the assigned task, scan the parcel, submit the permitted proof and record the collection. Rs 1000 collected remains rider-held until the receiving party acknowledges handover. Offline submissions display pending sync and commit only once when acknowledged.
